

THE COMPANY

Combisafe have been at the leading edge of Height Safety in Construction throughout Europe, for over 20 years. Combisafe systems have become the industry benchmark with their innovative modular approach, integrating solutions like the Steel Mesh Barrier and Multiclamp for fall prevention, with Safety Net Fans and Alsipercha for fall protection. The systems stand, or are combined into a total safety envelope.

The Combisafe Difference

The Combisafe systems concept has been developed over the years and now incorporates a vast range of product solutions, technical support, research and development projects, component testing, training, installation and consultancy service. Combisafe can support the needs of a project at any stage; however their early involvement will permit the greatest flexibility of solution, and will always produce improved results practically, commercially, and in terms of Safety

Industry not Product Driven

Even Combisafe's product grouping structure is married to the general Height Safety hierarchy, with Fall Prevention systems offered before Fall Protection systems, and Collective solutions offered before Personal ones. Alongside these product divisions, lie the Access products and the extensive array of Technical consultancy services.

Combisafe Prevention:

Within the collective Fall Prevention range, systems include the Steel Mesh Barrier S system that can integrate with the old timber solutions, and its partner the Steel Mesh Barrier C system for integration with scaffolding. Both are fully compliant with the relevant performance classes with the European Standard (EN 13374). Completing this group is the Net Barrier system, designed to satisfy the edge protection needs of steep roofs or large span structures, and meeting the performance requirements of both Class C within EN 13374, and System U within EN 1263.

Combisafe Protection:

The Fall Protection range includes the Safety Net fan, with specifications for both material and man catching. This system not only protects the site works from falls and falling materials but, as it absorbs the fall energy and contains the falling materials it also protects passers by. The man catching specification meets the performance requirements of System T within EN 1263. Within this group is Alsipercha, the flexible "sky hook" for concrete frame construction, the truck or trailer Loading System, and a full range of Miller Personal Fall Protective Equipment from Bacou Dalloz.

COMBISAFE®

Combisafe Access:

Within the Access grouping we have Site Stairways, for easy, flexible, safe access between levels, and Working platform systems to provide lightweight, modular, high level access without the need to restrict the area below.

Combisafe Services:

The Service offering includes full Technical Support with drawing and design integration capacity, and Bespoke Design for unique problems requiring individual solutions. There is extensive Training provided at various levels, both on specific product ranges and on all aspects of Work@Height Safety. The training is best accessed through one of the Safety Centres, which combine product display and system demonstration on an enclosed and weather proof three-storey frame, together with high quality meeting rooms and catering.

Alongside these services, Combisafe offers access to systems Installation, and project Consultancy for all aspects of Work@Height.

Pioneers

Combisafe's passion and commitment to performance Standards for all its system solutions is legendary. Combisafe hosted the first meeting of the technical committee for the European Standard for edge protection (EN 13374) back in 1994 in Östersund. Since then Combisafe has given freely of the years of experience represented within its technical teams, strengthening the drafting committees and maintaining the link between the resulting Standards, the leading edge of product development, and the major end user customers within the industry.

Combisafe around the World

Combisafe is currently expanding rapidly with operations across Europe and beyond. In 2006, it opened new sales offices in Norway, Denmark, France, Spain, the Netherlands and Dubai. Within a short period Combisafe will have a presence across the whole of Europe and has plans to develop sizeable sales and service operations in key overseas markets such as Australia and North America before the end of the decade.
